Ethernet

Chapter 12 in Stallings 10th Edition
Figure 12.1  Data Center Study—Percentage of Ethernet Links by Speed
Early on...

Earliest was ALOHA

- Developed for packet radio networks
- Station may transmit a frame at any time
- If frame is determined invalid, it is ignored
- Maximum utilization of channel about 18%

Next came slotted ALOHA

- Organized slots equal to transmission time
- Increased utilization to about 37%
ALOHA

- Packet Radio
- When station has frame, it sends it!
- Station listens (for max round trip time) plus small increment
- If ACK, fine. If not, retransmit
- If no ACK after repeated transmissions, give up.
- Frame check sequence (as in HDLC)
- If frame OK and address matches receiver, send ACK
- Frame may be damaged by noise or by another station transmitting at the same time (collision)
- Any overlap of frames causes collision
- Max utilization 18%
Slotted ALOHA

- Time in uniform slots equal to frame transmission time
- Need central clock (or other sync mechanism)
- Transmission begins at slot boundary
- Frames either miss or overlap totally
- Max utilization 37%
CSMA/CD Precursors

- Carrier Sense Multiple Access (CSMA)
  - Station listens to determine if there is another transmission in progress
  - If idle, station transmits
  - Waits for acknowledgment
  - If no acknowledgment, collision is assumed and station retransmits
  - Utilization far exceeds ALOHA
Channel Busy

Ready

1-Persistent:
- Transmit as soon as channel goes idle
- If collision, back off

Constant or variable delay

Nonpersistent:
- Transmit if idle
- If busy, wait random time and repeat process
- If collision, back off

P-Persistent:
- Transmit as soon as channel goes idle with probability P
- Otherwise, delay one time slot and repeat process
- If collision, back off

Figure 12.2 CSMA Persistence and Backoff
Nonpersistent CSMA

If the medium is idle, transmit; otherwise, go to step 2

Disadvantage:
Capacity is wasted because the medium will generally remain idle following the end of a transmission even if there are one or more stations waiting to transmit

If the medium is busy, wait an amount of time drawn from a probability distribution and repeat step 1
1-Persistent CSMA

- Avoids idle channel time
- Rules:
  1. If medium is idle, transmit
  2. If medium is busy, listen until idle; then transmit immediately
- Stations are selfish
- If two or more stations are waiting, a collision is guaranteed
P-Persistent CSMA

- A compromise to try and reduce collisions and idle time
- P-persistent CSMA rules:
  1. If medium is idle, transmit with probability $p$, and delay one time unit with probability $(1-p)$
  2. If medium is busy, listen until idle and repeat step 1
  3. If transmission is delayed one time unit, repeat step 1
- Issue of choosing effective value of $p$ to avoid instability under heavy load
Value of $p$?

- Have $n$ stations waiting to send
- At end of transmission, expected number of stations is $np$
  - If $np > 1$ on average there will be a collision
- Repeated transmission attempts mean collisions are likely
- Eventually all stations will be trying to send, causing continuous collisions, with throughput dropping to zero
- To avoid catastrophe $np < 1$ for expected peaks of $n$
  - If heavy load expected, $p$ must be small
  - Smaller $p$ means stations wait longer
Description of CSMA/CD

1. If the medium is idle, transmit; otherwise, go to step 2

2. If the medium is busy, continue to listen until the channel is idle, then transmit immediately

3. If a collision is detected, transmit a brief jamming signal to assure that all stations know that there has been a collision and cease transmission

4. After transmitting the jamming signal, wait a random amount of time, referred to as the backoff, then attempt to transmit again
CSMA/CD Operation

Figure 12.3 CSMA/CD Operation
Which Persistence Algorithm?

- IEEE 802.3 uses 1-persistent
- Both nonpersistent and p-persistent have performance problems

1-persistent seems more unstable than p-persistent

- Because of greed of the stations
- Wasted time due to collisions is short
- With random backoff unlikely to collide on next attempt to send
Binary Exponential Backoff

- IEEE 802.3 and Ethernet both use binary exponential backoff
- A station will attempt to transmit repeatedly in the face of repeated collisions
  - On first 10 attempts, mean random delay doubled
  - Value then remains the same for 6 further attempts
  - After 16 unsuccessful attempts, station gives up and reports error
- 1-persistent algorithm with binary exponential backoff is efficient over wide range of loads
- Backoff algorithm has last-in, first-out effect
Collision Detection

On baseband bus

- Collision produces higher signal voltage
- Collision detected if cable signal is greater than single station signal
- Signal is attenuated over distance
- Limit to 500m (10Base5) or 200m (10Base2)

On twisted pair (star-topology)

- Activity on more than one port is collision
- Use special collision presence signal

100BASE-X

- Uses a unidirectional data rate 100 Mbps over single twisted pair or optical fiber link
- Encoding scheme same as FDDI — 4B/5B-NRZI

Two physical medium specifications

**100BASE-TX**
- Uses two pairs of twisted-pair cable
- STP and Category 5 UTP allowed
- MTL-3 signaling scheme is used

**100BASE-FX**
- Uses two optical fiber cables
- Convert 4B/5B-NRZI code group into optical signals
100BASE-X Data Rate and Encoding

• Unidirectional data rate 100 Mbps over single link
  — Single twisted pair, single optical fiber

• Encoding scheme same as FDDI
  — 4B/5B-NRZI
  — Modified for each option
100BASE-X Media

- Two physical medium specifications
- **100BASE-TX**
  - Two pairs of twisted-pair cable
  - One pair for transmission and one for reception
  - STP and Category 5 UTP allowed
  - The MTL-3 signaling scheme is used
- **100BASE-FX**
  - Two optical fiber cables
  - One for transmission and one for reception
  - Intensity modulation used to convert 4B/5B-NRZI code group stream into optical signals
  - 1 represented by pulse of light
  - 0 by either absence of pulse or very low intensity pulse
100BASE-T4

- 100-Mbps over lower-quality Cat 3 UTP
  - Takes advantage of large installed base
  - Does not transmit continuous signal between packets
  - Useful in battery-powered applications
- Can not get 100 Mbps on single twisted pair
  - So data stream split into three separate streams
  - Four twisted pairs used
  - Data transmitted and received using three pairs
  - Two pairs configured for bidirectional transmission
- Use ternary signaling scheme (8B6T)
100BASE-T Options

100BASE-T

100BASE-X

100BASE-TX

2 Category 5 UTP

100BASE-FX

2 Optical Fiber

100BASE-T4

4 Category 3 or Category 5 UTP
Full Duplex Operation

- Traditional Ethernet half duplex
- Using full-duplex, station can transmit and receive simultaneously
- 100-Mbps Ethernet in full-duplex mode, giving a theoretical transfer rate of 200 Mbps
- Stations must have full-duplex adapter cards
- And must use switching hub
  - Each station constitutes separate collision domain
  - CSMA/CD algorithm no longer needed
  - 802.3 MAC frame format used
Mixed Configurations

- Fast Ethernet supports mixture of existing 10-Mbps LANs and newer 100-Mbps LANs
- E.g. 100-Mbps backbone LAN to support 10-Mbps hubs
  - Stations attach to 10-Mbps hubs using 10BASE-T
  - Hubs connected to switching hubs using 100BASE-T
    - Support 10-Mbps and 100-Mbps
    - High-capacity workstations and servers attach directly to 10/100 switches
  - Switches connected to 100-Mbps hubs using 100-Mbps links
  - 100-Mbps hubs provide building backbone
    - Connected to router providing connection to WAN
Gigabit Ethernet - Differences

• Carrier extension
  — At least 4096 bit-times long (512 for 10/100)

• Frame bursting
  — allow multiple frames to be transmitted consecutively, i.e. “together”

• Not needed if using a switched hub to provide dedicated media access
Gigabit Ethernet – Physical

- **1000Base-SX**
  - Short wavelength, multimode fiber
- **1000Base-LX**
  - Long wavelength, Multi or single mode fiber
- **1000Base-CX**
  - Copper jumpers <25m, shielded twisted pair
- **1000Base-T**
  - 4 pairs, cat 5 UTP
Figure 12.5  Gigabit Ethernet Medium Options (log scale)
10Gbps Ethernet

- Growing interest in 10Gbps Ethernet
  - High-speed backbone use
  - Future wider deployment
- Alternative to ATM and other WAN technologies
- Uniform technology for LAN, MAN, or WAN
- Advantages of 10Gbps Ethernet
  - No expensive, bandwidth-consuming conversion between Ethernet packets and ATM cells
  - IP and Ethernet together offers QoS and traffic policing approach ATM
  - Have a variety of standard optical interfaces
Figure 12.6  Example 10 Gigabit Ethernet Configuration
10Gbps Ethernet Distance Options (log scale)

- **10GBASE-S** (850 nm)
  - 50-µm multimode fiber
  - 62.5-µm multimode fiber

- **10GBASE-L** (1310 nm)
  - Single-mode fiber

- **10GBASE-E** (1550 nm)
  - Single-mode fiber

- **10GBASE-LX4** (1310 nm)
  - 50-µm multimode fiber
  - 62.5-µm multimode fiber

Maximum distance: 10 m to 100 km
100-Gbps Ethernet (100GbE)

- Preferred technology for wired LAN
- Preferred carrier for bridging wireless technologies into local Ethernet networks
- Cost-effective, reliable and interoperable
- Popularity of Ethernet technology:
  - Availability of cost-effective products
  - Reliable and interoperable network products
  - Variety of vendors
Figure 12.8 Example 100-Gbps Ethernet Configuration for Massive Blade Server Site
Multilane Distribution

used to achieve the required data rates

- **Multilane distribution:**
  - Switches implemented as multiple parallel channels
    - Separate physical wires

- **Virtual lanes:**
  - If a different number of lanes are actually in use, virtual lanes are distributed into physical lanes in the PMD (physical medium dependent) sublayer
  - Form of inverse multiplexing
100 Gbps aggregate stream of 64B/66B words

**Naming nomenclature:**
- Copper: K = backplane; C = cable assembly
- Optical: S = short reach (100m); L = long reach (10 km); E = extended long reach (40 km)
- Coding scheme: R = 64B/66B block coding
- Final number: number of lanes (copper wires or fiber wavelengths)
