Lab Assignment #0

Fall 2020

The purpose of this assignment is to refresh your memory concerning the use of C/C++, and to (re)introduce you to C's raw I/O system calls.

For this assignment, you are to open and read the file specified on the command line, and print it out on the display. For example, if you were to type:

```
a.out file.txt
```

Your program should open the file named `file.txt`, read it into a buffer (ie, an array of `char`), and then print it out. Your program should use the `open` and `read` system calls, *NOT* the higher level `scanf` or `cin` routines available in C/C++.

This program is for practice only - you do not need to turn it in.
