CS270 - System Software
Lab Assignment #4
Fall 2016

The purpose of this assignment is to give you practice with Perl.

Re-do your assignment # 3, except this time write the program in Perl instead of the shell. The operation of the program should be identical to that of your program # 3, except this time your program should accept any reasonable combination of options. In particular, the `-i` option makes sense used in combination with several of the other options. When combining options, both individiual options (for example, `rf -i -f`) and combined options (`rf -if`) should be allowed.
